

# DEER MAGNET

FORAGE MIXTURE

## *A YEAR ROUND DEER ATTRACTANT*

High performance grass and legumes for palatability and nutritional benefit. Deer Magnet will increase the frequency of feeding, improve antler development, increase doe lactation, and produce better developed offspring.

### FORMULA

30% Candy Stick Festulolium  
30% Royal Medium Red Clover  
20% Sprint II Alfalfa  
10% Ladino Clover  
10% Alsike Clover

### CANDY STICK FESTULOLIUM

A very palatable grass that is high in energy and nutrient value. Festulolium is a cross between Meadow Fescue and Perennial Ryegrass. This cross captures the high palatability and forage quality identified with perennial ryegrass yet improves winter-hardiness and consistent summer growth of the Meadow Fescue. Candy Stick Festulolium will be the first grass eaten in the food plot and will provide improved digestion, protein and minerals.

### ROYAL MEDIUM RED CLOVER

Royal Medium Red Clover provides an excellent source of energy, protein, and calcium required to increase weight gains and antler development.

### SPRINT II ALFALFA

Sprint II is a high yielding, high quality alfalfa variety that produces exceptional feed value. Sprint II was selected because of its unique growing traits. Sprint II remains more vegetative than conventional alfalfa varieties and therefore will attract deer to the plot longer. Alfalfa is important to deer for its calcium, protein and vitamins to improve weight gains and antler development.

### LADINO CLOVER

Ladino Clover is the most palatable forage clover because when it goes to flower the deer will continue to eat it while rejecting other legumes. Ladino clover is an excellent source of calcium, protein, and energy required by white tail deer.

### ALSIKE CLOVER

Alsike clover is an easy to establish clover for poor quality soils. It provides a good source of energy, protein, and calcium required by deer.

### PLANTING & SEEDING INSTRUCTIONS

This mixture is best planted in the spring when moisture is adequate.

Recommended Seeding Rate is 20 -25 lbs per acre in a well prepared seed bed.

This will reduce competition and extend length of performance.

### FERTILIZATION

**Recommendation:** Apply 300 lbs. High Calcium Lime and 200 lbs 7-8-7 GreenGuard Vegetable & Flower Fertilizer before seeding and annually every fall. This will extend the life of stand, attract more animals and improve forage quality.

**Maintenance:** To attract deer all season long mow every three times during the summer. For improved fall performance cut plot sometime in early August and fertilize.
